FIT5032 Internet Applications Development

Assessed Lab 1

Development Environment Setup and Basic Vue.js Component

Student Name	Wei Zhang
Student ID	36668699
Tutorial/Lab	Tuesday 2:00 pm

Tutor Name: Yujie Wang

29 June 2026

1 Lab Overview

This report presents the evidence completed for FIT5032 Assessed Lab 1. The lab focuses on setting up the Vue.js development environment, running a basic Vue.js application on localhost, creating a new component named `MyName.vue`, preparing a GitHub account, and engaging with peers during the laboratory activity.

All implementation tasks and evidence in this report were completed individually. Peer interaction was limited to technical discussion and mutual support during the laboratory session.

2 eFolio Task 1.1: Running a Basic Vue.js Application

2.1 Development Environment

The following software and tools were prepared for the Week 1 laboratory activity:

- Node.js LTS and npm;
- Visual Studio Code;
- Vue – Official extension for Visual Studio Code; and
- a Vue.js 3 project created using `npm create vue@latest`.

The project dependencies were installed with the following command:

```
npm install
```

The local development server was then started using:

```
npm run dev
```

2.2 Evidence of the Running Application

Figure 1 shows Visual Studio Code and the browser window side by side. The terminal displays the running Vue.js development server, while the browser displays the application through a localhost address.

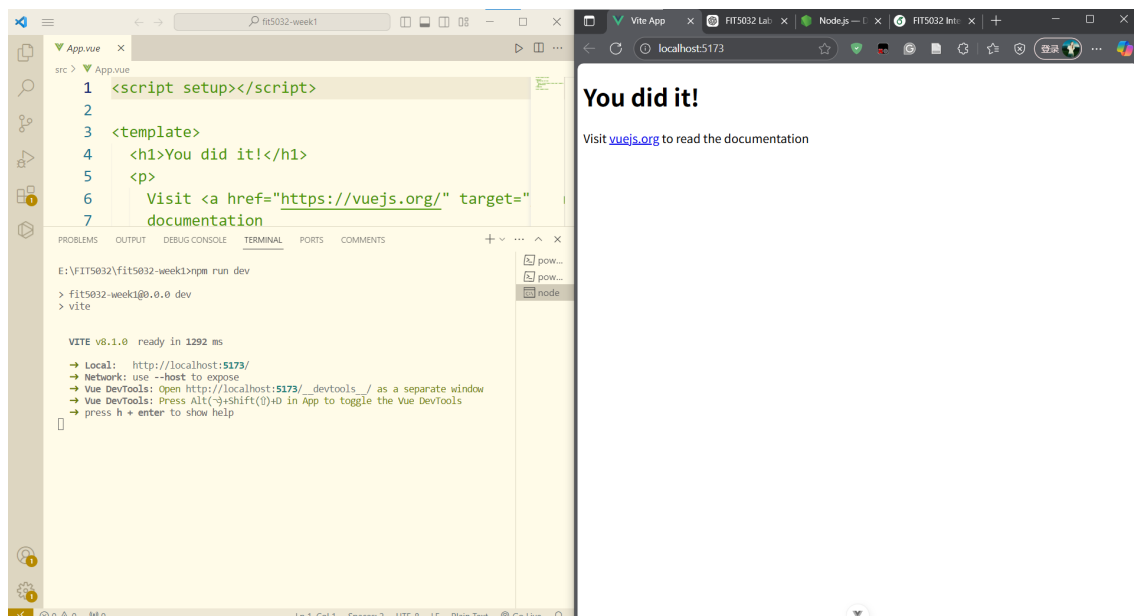

Figure 1: Visual Studio Code and the basic Vue.js application running on localhost.

Brief description: The screenshot demonstrates that the Vue.js project was opened successfully in Visual Studio Code and that the application could be accessed from the browser through localhost.

3 eFolio Task 1.2: Creating the `MyName.vue` Component

3.1 Component Implementation

A new Vue component named `MyName.vue` was created in the `src/components` directory. The component contains a template that displays the student's name on the welcome page. It was then imported into `App.vue` and included in the root application template.

Figure 2 presents the completed `MyName.vue` source code in Visual Studio Code.

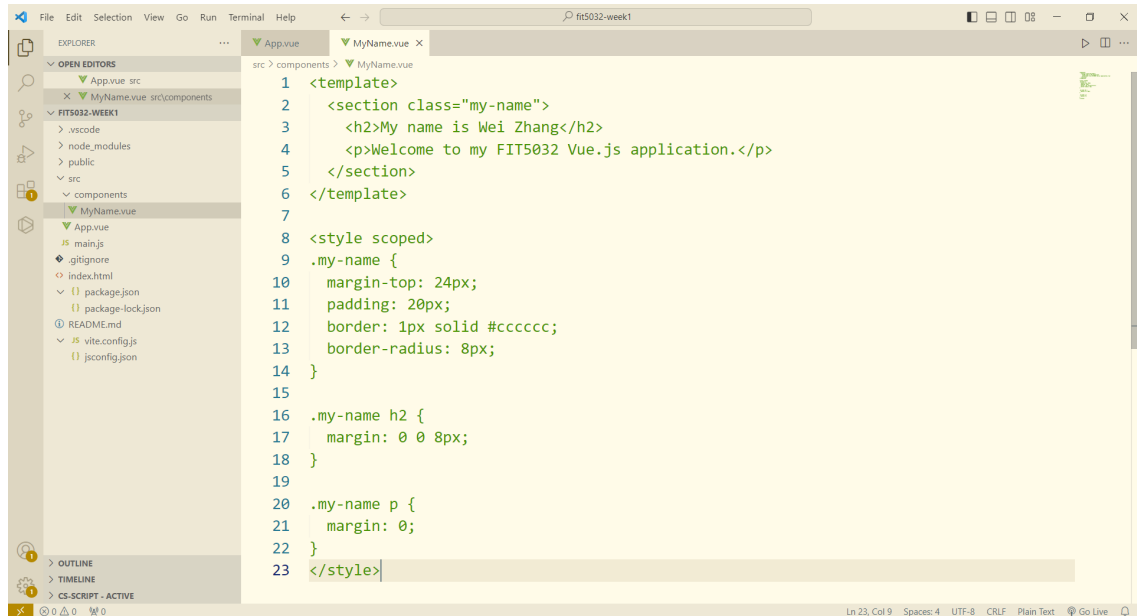

Figure 2: The `MyName.vue` component opened in Visual Studio Code.

3.2 Modified Welcome Page

After the component was imported and rendered in `App.vue`, the browser automatically updated through Vue's hot-reload functionality. Figure 3 shows the modified welcome page displaying the output of the `MyName.vue` component.

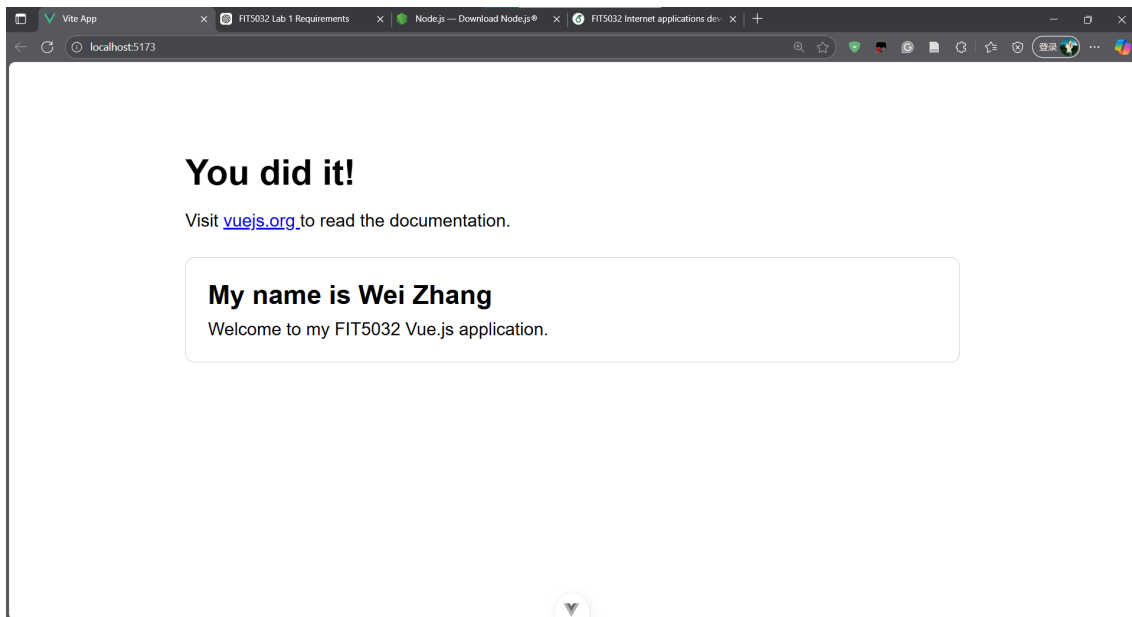

Figure 3: The modified Vue.js welcome page displaying the student's name.

Brief description: The screenshot confirms that the new component was registered correctly and that its content was rendered successfully in the browser.

4 GitHub Account

The GitHub account prepared for FIT5032 is shown below:

--------------------	---

5 Peer Engagement

During the Week 1 laboratory activity, I engaged with my peers in a technical discussion about setting up the Vue.js development environment. We discussed how to install Node.js, create a Vue.js project, run the application on localhost, and import a new Vue component into App.vue. All assessed implementation work was completed individually.

6 Completion Summary

The required tasks for Assessed Lab 1 were completed successfully. The Vue.js development environment was configured, the starter application was run on localhost, and a new `MyName.vue` component was created and displayed on the welcome page. The required screenshots, GitHub account URL, and peer-engagement description have been included in this report.
